

Soil Strategies for Stormwater Management, Erosion Control, and Landscape Success

by David McDonald
Seattle Public Utilities
david.mcdonald@seattle.gov
for the Washington Organic Recycling Council
info@compostwashington.org

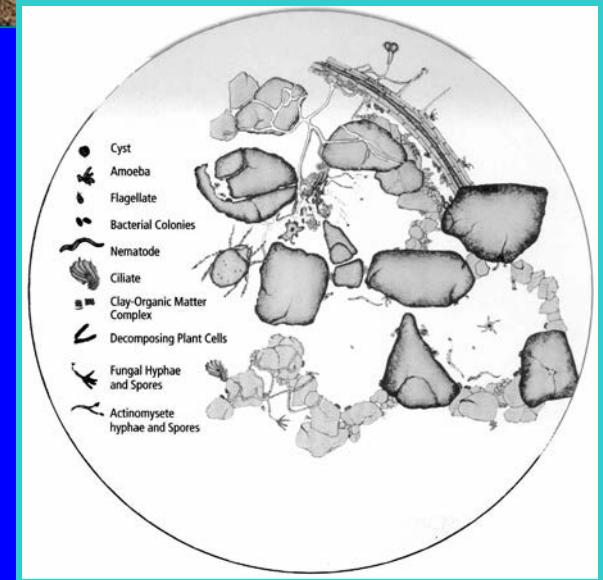

www.SoilsforSalmon.org

Value of Healthy Soil

Billions of soil organisms:

- Support healthy plant growth, fertilize, protect plants from disease
- Create soil structure, resist compaction
- Provide stormwater infiltration
- Prevent erosion
- Reduce summer water needs
- Filter out pollutants (oil, metals, pesticides, etc.)
- Reduce need for landscape chemicals

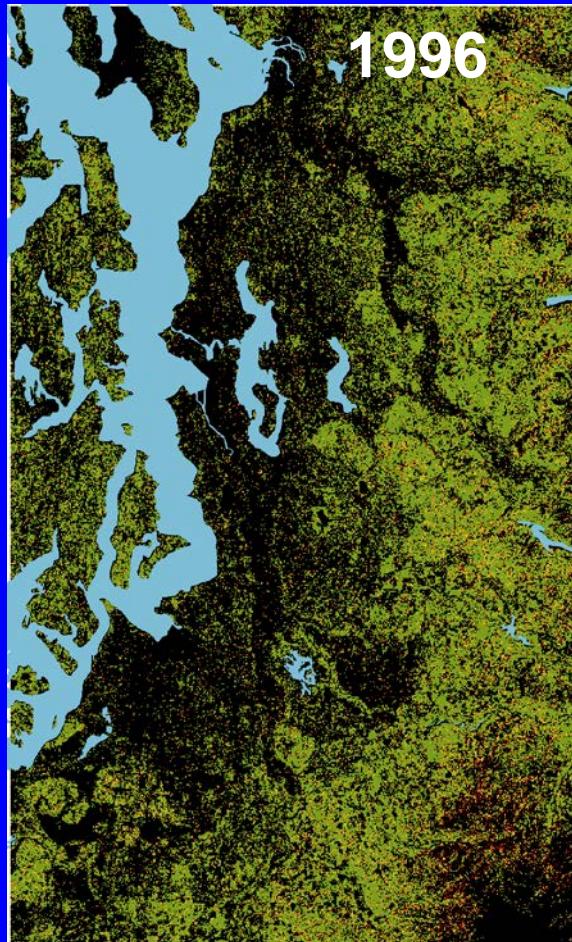

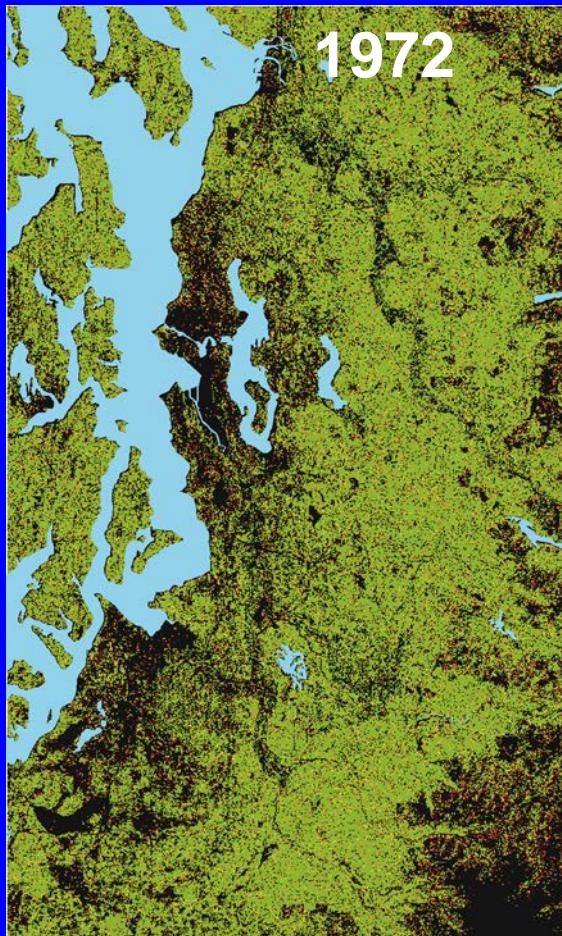

The Connection Between Soil and Water

The Stormwater Problem: Impacts of turning spongy forests into cities

1972-1996: Amount of land with 50% tree cover decreased by 37% in Puget Sound region (from 42% of land down to 27%).

Impervious surface
(roads, buildings)
increased
proportionately.

WA population
doubled 1962-98.

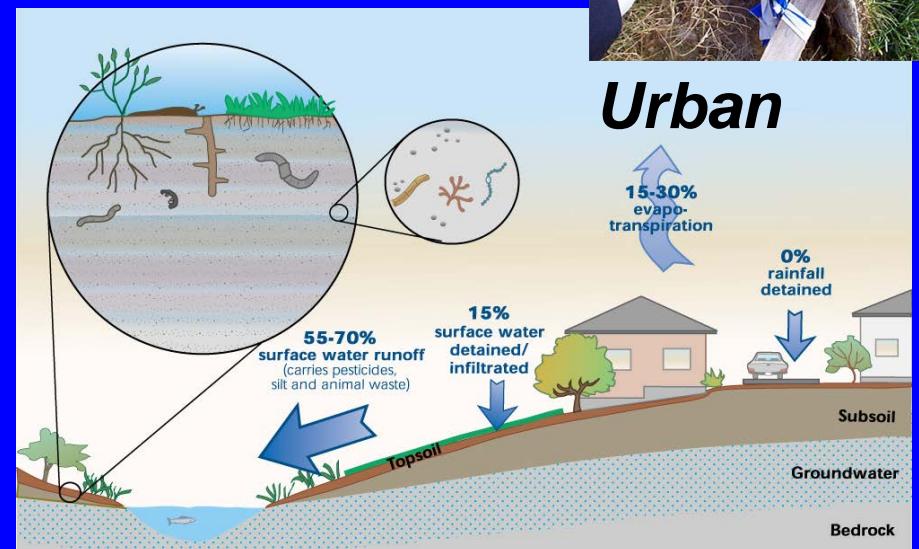

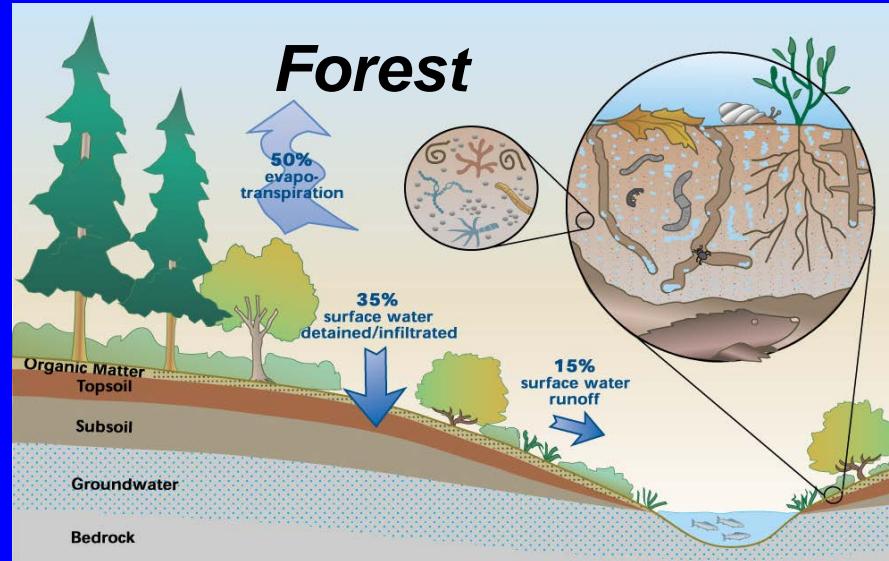

**2.7 million more
people by 2020!**

What happens to soils and soil functions as we turn forests into cities?

- ↑ compaction
- ↑ erosion
- ↑ loss of topsoil
- ↓ soil organisms
- ↓ soil structure
- ↓ natural fertility & disease prevention
- ↑ impervious surface

cause:

- ↑ winter runoff
- ↑ need for irrigation & chemicals
- ↓ biofiltration of pollutants

What happens to streams as we turn forests into cities?

↑runoff = ↑peak storm flows

↑erosion of stream bank and bed

↑fine sediment choking spawning gravels

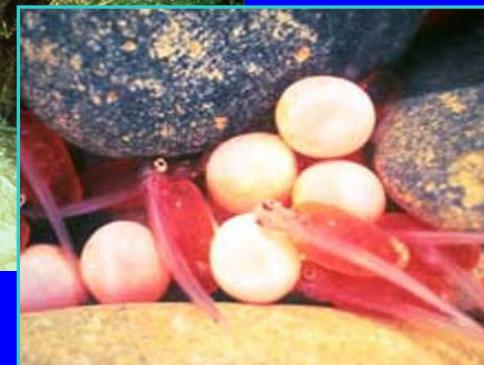

↑pollutants (automotive, landscape
fertilizer and pesticides)

↓groundwater recharge

↓summer low flows

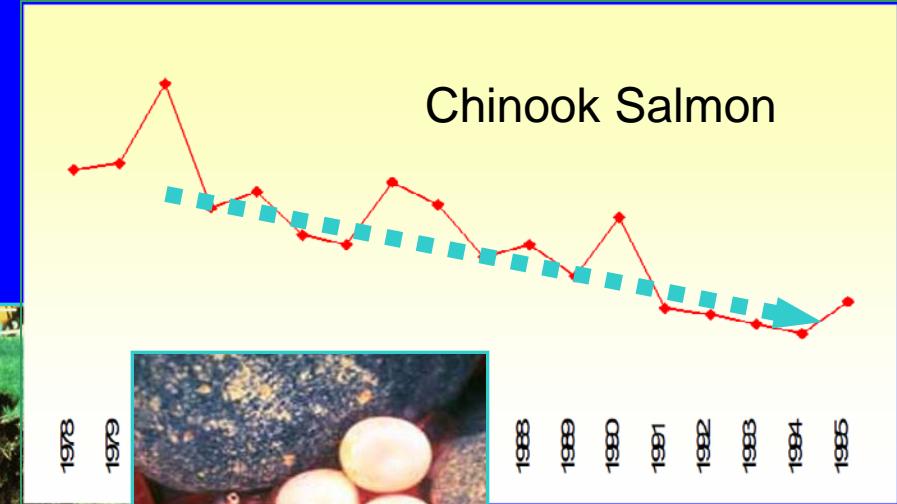

↑summer stream temperature

↓oxygen in spawning gravels

What are the impacts?

- Pollution
- Erosion
- Salmon decline
- Flooding & property damage
- Failing landscapes
- Unhappy customers

How can we restore soil functions, to improve plant growth, water quality, and reduce runoff?

- Prevent /reduce compaction
 - keep heavy machinery off where possible
 - rip compacted soils to loosen
- Incorporate compost into soil to feed soil life

organic matter + soil organisms + time
creates ⇒
soil structure, bio-filtration, fertility, & stormwater detention

Soil Best Management Practices (BMPs)

New Construction

- Retain and protect native topsoil & vegetation (esp. trees!)
 - Minimize construction footprint
 - Store and reuse topsoil from site
 - Retain “buffer” vegetation along waterways
- Restore disturbed soils by tilling 2-4" of compost into upper 8-12" of soil. Rip to loosen compacted layers.

Existing Landscapes

- Retrofit soils with tilled-in compost when re-landscaping
- Mulch beds with organic mulches (leaves, wood chips, compost), and topdress turf with compost
- Avoid overuse of chemicals, which may damage soil life

Benefits of Soil Best Practices

- More marketable buildings
- Better erosion control
- Easier planting, healthier plants, fewer callbacks
- More attractive landscapes, that sell the next job
- Easier maintenance for customers (healthier plants, fewer weeds, less need for water, fertilizer, pesticides)
- Reduced stormwater runoff, with better water quality
- Regulatory compliance (current and upcoming regs)

WA State Guidance on Soil BMPs: DOE *Stormwater Mgmt. Manual for Western WA*

- Equivalency required for NPDES Phase I
(big cities, counties, WsDOT)
 - Phase II (medium-sized cities) coming soon
- Volume V, Chapter 5 - “On-Site Stormwater Mgmt.”
 - **BMP T5.13 Post-Construction Soil Quality and Depth**
- Flow model credits for runoff dispersion into amended soils

www.ecy.wa.gov/programs/wq/stormwater/manual.html

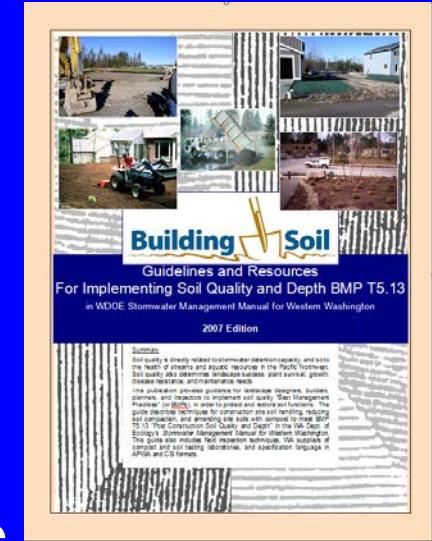

DOE BMP T5.13

Post Construction Soil Quality and Depth

- Retain native soil and duff wherever possible
- All areas cleared and graded require 8 inch soil depth:
 - **Soil organic matter content 10% for landscape beds, 5% for turf areas,** (S.O.M. by loss on combustion method)
 - 10% S.O.M. results from roughly 30-40% compost by volume added to low-organic subsoil.
 - May use native topsoil, incorporate organic amendments into existing soil, or bring in topsoil blend to meet spec
 - pH 6-8, or original pH
 - Subsoil scarified 4 inches below 8-inch topsoil layer
 - Protected from compaction after amendment
 - Mulched after planting, & maintained by leaving organic debris

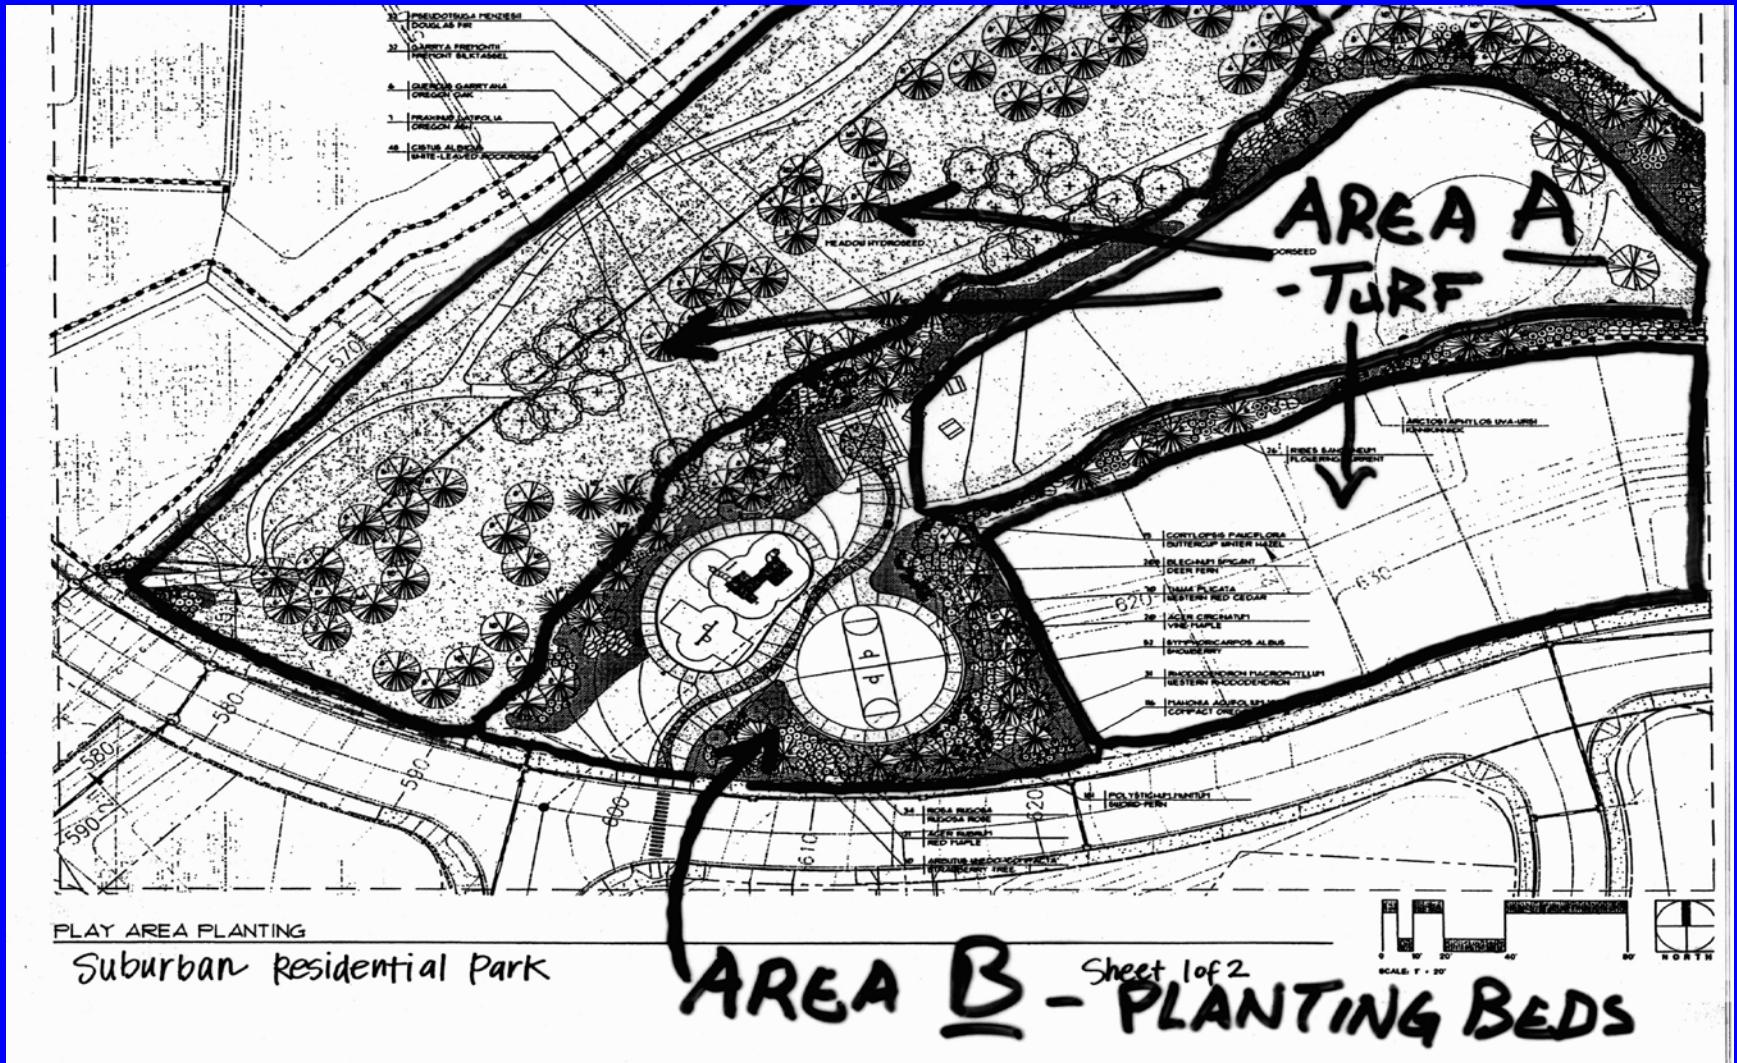

Building Soil guidelines manual for implementing BMP T5.13

- Manual developed regionally with experts
- Practical methods to achieve soil standards:
- Develop a “Soil Management Plan” for each site
- Four options for soil management in different areas of site:
 - 1) Leave native soil & vegetation undisturbed, protect from compaction
 - 2) Amend existing soil in place (with compost or other organic)
 - 3) Stockpile site topsoils prior to grading for reapplication
 - 4) Import topsoil meeting organic matter content standards
- Choose pre-approved or custom calculated amendment rates
- Simple field inspection and verification procedures
- Includes model specs written in CSI and APWA formats
- Available at: www.SoilsforSalmon.org

Develop a “Soil Management Plan”

step 1: Identify areas needing different soil treatments

Soil Management Plan

step 2:
Compute amendment
or amended topsoil
and mulch needed
for each area

*This form is in the
Building Soil manual at
www.SoilsforSalmon.org*

MODEL "SOIL MANAGEMENT PLAN" FOR BMP TS-13

PROJECT INFORMATION

COMMENTS:

Clearing up the confusion about “% organic”

“% Soil Organic Matter Content” (S.O.M.) in lab soil tests
is by loss-on-combustion method

- Most composts are 40-60% organic content by this method

Recommended soil amendment rates
(for low-organic soils):

- 5% Soil Organic Matter Content for Turf
- produced by about 20% compost amendment by volume
- 10% Soil Organic Matter Content for Landscape Beds
- produced by 30-40% compost amendment by volume

How to Select Compost

Know your supplier!

- Field tests:
 - earthy smell - not sour, stinky, or ammonia
 - brown to black color
 - uniform particle range
 - stable temperature (does not get very hot if re-wetted)
 - moisture content
- Standards & Specs
 - US Compost Council “Seal of Testing Assurance” (STA)
 - State & DOT specs
- Mfr.-supplied info:
 - Meets state std. or USCC STA
 - C:N ratio
 - Weed-seed trials
 - Nutrients, salinity, contaminants
 - Size: “screen”, % fines
- Soil/compost lab test info:
 - Nutrients
 - Salinity
 - pH
 - % organic content (OM)

Carbon to Nitrogen ratio of composts

- For turf & most landscapes
C:N ratio of 20:1 to 25:1 - good nutrient availability for first year of growth (no other fertilizer needed)
- For native plants and trees
C:N ratio of 30:1 to 35:1, and coarser (1" minus screen)
 - less Nitrogen better for NW natives, discourages weeds
 - for streamside, unlikely to leach nitrogen

Compost Application Methods

Four options for soil management in different areas of site:

- 1) Leave native soil & vegetation undisturbed, protect from compaction
- 2) Amend existing soil in place (with compost or other organic)
- 3) Stockpile site topsoils prior to grading for reapplication
- 4) Import topsoil meeting organic matter content standards

Compost application & incorporation methods:

- Blowing
- Spreading
- Tilling / ripping
- Blending off-site

Blowing & spreading

- Blower trucks

- Various construction grading equipment

- Other equipment :
golf course & farm spreaders

Incorporating amendments into soil

- Range of equipment for different-sized sites
- Till in to 8" depth
- If compacted, rip to 12" depth before/while amending

Stockpile site soils & amend, (or import amended topsoil) after road & foundation work

- Allows mass grading
- Can reduce hauling & disposal costs
- Set grade to allow re-addition of topsoil & allow for settling
- Amend to spec offsite
- Spread after concrete work
- Rip in first lift,
to reduce sub-grade compaction

Erosion Control Compost Applications

- Compost berms or blankets – slow water, bind surface soil, reduce erosion immediately
- Enhance survival/growth helps to stabilize slopes over long term.

Combine methods as needed
for best water quality and flow control

WsDOT - Protecting Wetland Area from I-5 Runoff

Soil Amendment: A cost-effective solution for new development

- Much better plant survival
= fewer callbacks

- Easier planting

- Can cut irrigation needs by 50%
= 3-7 year payback on irrigation savings alone

Selling healthy soil to customers:

Value to builder/contractor

- Less plant loss = fewer callbacks
- Making money on materials and labor
- Quicker planting in prepped soil
- Easier maintenance
- Better appearance sells next job

Sell quality & savings to customer

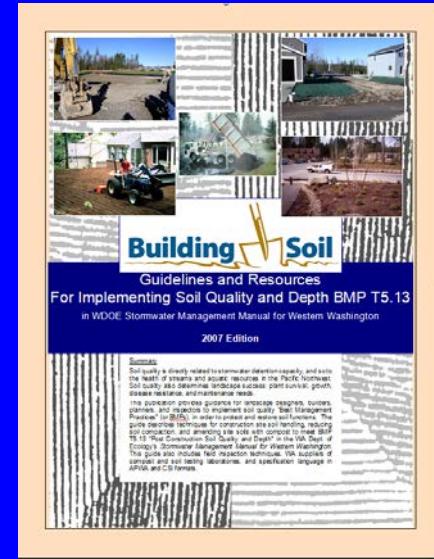

- Better plant survival/ health/ growth/ appearance
- Lower water bills, easier care
- Reduced chemical needs = better for family health
- Better for salmon: reduces storm runoff, improves water quality

Putting Organic Amendments to Work

Redmond Ridge, Quadrant Corp.

- Large, master-planned development
- Forest left undisturbed where possible - no compaction
- Cleared vegetation & duff stockpiled for use as soil amendment
- Removed topsoils stockpiled
- All soils amended to 12" depth with organics
- **Early Problems:** Too much organic esp. for turf areas, organic materials not composted (landclearing & duff) - soft soil, excessive water retention, low N, plant/turf problems as result

Redmond Ridge: current method

- Grade site 12 in. below finish
- Install foundation, along with driveway & walkway rock pads
- Spread 14 in. amended soil mix, (will settle to 12 inches) rip in first lift to mix with subsoil
- Soils blended offsite from native duff plus compost
- Soil organic matter controlled to ~10%, pH and C:N ratio for optimal plant growth

Putting organics to work - SEA Streets

Street Edge Alternative
onsite detention demo,
Seattle Public Utilities
and SDOT.

- Compost in wet and dry zones
- **98% reduction in runoff.**

Which site is selling the next job?

A natural solution – for healthier streams, happier customers, and successful landscapes

- Conserve existing soils and vegetation where possible.
- Restore natural functions in disturbed soils by reducing compaction and using organic amendments.
